
Website deployment *guide.*

Everything you need to do, in order, with nothing assumed. If you can fill in a form online, you can do all of this. Take your time, and do not skip a step just because it looks small.

START HERE

Before you begin

Six things to set up. They build on each other, so please do them in order. Part 1 is the important one; everything after it is measurement.

What you need

- A computer with a web browser. A phone will not work for this.
- Your Google account, signed in.
- About **45 minutes** in total. You can stop between parts and come back.
- A quiet hour. Some steps involve copying long codes, and it is easy to lose one character.

You cannot break anything

Nothing in this guide deletes data or costs money. If a screen does not look like the description, stop and send us a screenshot rather than guessing. That is always the right move.

A note on the words. A few names come up repeatedly. **Netlify** is the company that stores your website and shows it to visitors. **GoDaddy** is where your web address `workingwithgod.live` is registered. **Google Apps Script** is a small program that lives inside your own spreadsheet. You do not need to understand any of them beyond that.

What you will have when you finish

- 01** Registrations arrive in your email and a spreadsheet
One tab per form, sortable by month, and a Notes column that is yours

- 02** The new website is live on the internet
On a temporary address first, so we can check it safely

- 03** workingwithgod.live points at the new site
Your email keeps working throughout

- 04** Google Analytics tells you who visits
How many people, from where, which pages

- 05** Google Search Console shows how people find you
What they typed into Google before they landed

- 06** Microsoft Clarity records how people use the site
Where they scroll, where they click, where they give up

PART 01

Registrations into your inbox and a spreadsheet

Right now, when someone registers for the Roundtable, nothing happens on the new site. This part makes two things happen at once: an email arrives for you, and a row appears in a spreadsheet that belongs to you.

About 15 minutes

Step by step

- 01** Go to `sheets.google.com` and click the big + to make a blank spreadsheet.
Name it **WWG Registrations** by clicking "Untitled spreadsheet" at the top left.

- 02 Look at the web address at the top of your browser. It is long. You need the middle part of it.

THE ADDRESS LOOKS LIKE THIS

docs.google.com/spreadsheets/d/**1AbC...longcode...XyZ**/edit

Copy the bold part, between `/d/` and `/edit`. That is your **Sheet ID**. Paste it somewhere safe for a moment.

- 03 In the spreadsheet menu, click **Extensions**, then **Apps Script**. A new tab opens with a code editor.

Do not be put off by this. You will paste something in and never look at it again.

- 04 Select everything already in that editor and delete it. Then paste in the file we sent you called `Code.gs`.

- 05 Near the top of what you pasted, find these two lines and fill them in. Change only the words inside the quote marks. Leave the word `const`, the quote marks and the semicolon exactly as they are.

CHANGE THESE TWO

```
const SHEET_ID = 'paste your Sheet ID here';  
const NOTIFY_TO = 'eliyahu@workingwithgod.live';
```

Edit the lines that are already there. Do not type these in as new lines underneath. Each name must appear once in the file. Two copies of the same one and the script refuses to run.

A little below them is a third line, `const SECRET = ''`; **Leave it exactly as it is**, with nothing between the quote marks. It is an optional password we can switch on once registrations are arriving. Setting it now is the easiest way to end up with a setup that looks finished and quietly records nothing.

- 06 Click the **Save** icon, then the blue **Deploy** button at the top right, then **New deployment**.

Click the gear icon next to "Select type" and choose **Web app**.

This is the only time you use "New deployment". Every later change goes through **Deploy > Manage deployments > the pencil icon > Version: New version**, which keeps the same web address. Choosing "New deployment" a second time creates a *different* address and quietly leaves the old one running the old code, so your changes appear to have no effect.

- 07 Two dropdowns appear. Set them exactly like this:

THESE TWO SETTINGS MATTER MORE THAN ANYTHING ELSE HERE

Execute as: Me
Who has access: Anyone

"Anyone" — not "Anyone with a Google Account"

These two options sit next to each other and the second one sounds safer. It is the single most common way this whole setup fails.

If you pick the wrong one, Google quietly answers every registration with a hidden sign-in page instead of running your script. Nothing appears in the spreadsheet, no error is recorded anywhere, and the website still says "thank you" to the person registering. There is no warning of any kind. Read the option twice before clicking Deploy.

- 08 Click **Deploy**. Google asks you to authorise. Click through, choose your account, and you will hit a warning screen that says *Google hasn't verified this app*.

This warning is expected

It appears for every private script that has not been submitted to Google for review. Yours never will be, because only you use it. Click **Advanced** at the bottom left, then **Go to (your project name)**, then **Allow**.

- 09 Google now shows you a **Web app URL**. Copy it and send it to us. That is the last thing we need from Part 1.

IT MUST END IN /EXEC

<https://script.google.com/macros/s/AKfycb.../exec>

If it ends in /dev , it is the wrong address

Apps Script also shows a second address ending `/dev` . That one only works for people signed in to your Google account — which means it works perfectly when *you* test it in your browser, and fails for everyone and everything else. It is the reason people spend days on this. Check the last four characters.

Treat this address like a password

Anyone who has it can write rows into your spreadsheet. Do not put it in a screenshot, a shared document, or a social post. Email it to us and leave it there.

- 10 Test it before you send it. Paste that same `/exec` address into your browser's address bar and press Enter. You should see a line of text like this:

WHAT A WORKING SETUP REPLIES

```
{"ok":true, "keyCheck":"off", "sheetOk":true,
"sheet":"WWG Registrations",
"verdict":"All good. Submissions will be recorded."}
```

Read the **verdict**. If it says anything other than "All good", it tells you which part is wrong. If instead you get a Google sign-in page, the **Who has access** setting in step 7 is on the wrong option — go back and set it to **Anyone**.

How you will know it worked

Once we connect it, register on the site yourself using your own email address. Within a minute you should see an email arrive, and your details appear as a new row on the `Roundtable` tab of the spreadsheet.

About the spreadsheet. Three tabs are created automatically, one for each kind of form: `Roundtable`, `Contact` and `Daily quote`. There will only ever be those three, however many years pass. Each tab holds only the columns that form actually asks for, so the `Roundtable` tab is not half full of empty message boxes.

The first column is **Month**, written as `2026-09`. Click the little filter arrow at the top of it to show one month at a time. The last column is **Notes** and nothing ever writes to it, so it is yours: jot down who turned up, who to follow up with, anything you like.

PART 02

Putting the website live

The new site needs a home on the internet. That is Netlify. We do most of this, but two switches are yours, and the site cannot receive registrations without them.

About 5 minutes

- 01 Sign in at `app.netlify.com`. You will see your site listed. Click it.
- At the top there is a temporary web address ending in `.netlify.app`. Click it and have a look around the new site. Nothing here is public yet.
- 02 In the left menu click **Site configuration**, then **Forms**.
- Turn on **Form detection**.

- 03 Now go to **Deploys** in the top menu, click **Trigger deploy**, then **Deploy site**. Wait until it says *Published*, usually under two minutes.

Do not skip this rebuild

Netlify only looks for your form while it is building the site. Turning the switch on does nothing to the version already published. Without this rebuild, the switch is decorative.

- 04 Go to **Site configuration**, then **Notifications**, then **Emails and webhooks**. Find the box called **Form submission notifications** — the lower one, not Deploy notifications. Click **Add notification** and choose **Email notification**. Fill it in, save, and then **repeat for each of the three forms**:

EMAIL TO NOTIFY	FORM	WHAT IT COVERS
eliyahu@workingwithgod.live	roundtable	Roundtable registrations
eliyahu@workingwithgod.live	contact	Messages from the Contact page
eliyahu@workingwithgod.live	dailyQuote	Daily quote sign-ups

Three separate notifications, all going to the same address. If the **Form** dropdown offers **Any form**, choose that instead and one notification covers all three — including any form we add later.

Only `roundtable` is set up at the moment

If someone uses the Contact page or signs up for the daily quote today, the message is safely stored in Netlify but no email reaches you. Adding the other two takes about a minute each and is worth doing now.

Why this is separate from the spreadsheet. These emails are sent by Netlify itself and do not depend on the spreadsheet, the Google script, or anything else working. If the Google side ever breaks, registrations still reach your inbox — and every submission is stored under **Forms** in Netlify regardless, where nothing can lose it. Three independent places, on purpose.

You may receive two emails per registration: one from Netlify (`formresponses@netlify.com`) and one from your own Google script. That is expected. The one from your script is the useful one — pressing Reply on it writes back to the person who registered. Once you are happy everything is working, you can delete the Netlify one if the duplicates annoy you.

Pointing workingwithgod.live at the new site

Your web address currently points at the old GoDaddy site. This changes where it points. It is the only step in this guide that carries any real risk, so read the warning first.

About 10 minutes, then a wait

Never change the nameservers

There is popular advice online — including video tutorials — that says the way to connect a GoDaddy domain is to replace its **nameservers** with the host's. Do not do that here. It would hand your entire address book to Netlify, and your email records do not come with it.

Your mail runs on this same address through Microsoft 365, and it depends on **nine separate records** that live at GoDaddy right now: your MX record, an SPF record, a Microsoft verification record, autodiscover, msoid, email, _domainconnect, and two Teams records. Switching nameservers leaves every one of them behind, and mail to eliyahu@workingwithgod.live stops arriving that day.

Worse, it is the slow option, not the fast one: undoing a nameserver change can take up to **48 hours**, and you cannot speed it up. The method below changes three rows, never touches your email, and can be undone in about ten minutes.

The two things to have open. GoDaddy, on the DNS page for `workingwithgod.live`. And Netlify, on **Domain management**, where you add `workingwithgod.live` and `www.workingwithgod.live` to the site first — choosing **"Use a third-party external DNS provider"** when it asks.

- 01 Sign in at GoDaddy. Find `workingwithgod.live` in your products, then open **DNS** or **Manage DNS**.

You will see a table of rows with columns like Type, Name and Value. This is the address book that tells the internet where to find your things.

- 02 *Optional, but it makes the switchover about six times quicker.* An hour before you do the rest, edit the `A` rows and the `www` row and set each one's **TTL** to **Custom > 600 seconds**. Save, then leave it for an hour and come back.

TTL is how long the rest of the internet is allowed to remember the old answer. Lowering it first shrinks the gap where the site is half-switched from about an hour to about ten minutes. Change nothing else while you are in there.

- 03 Find the row where **Type** is `A` and **Name** is `@`. Edit it and replace the value with:

NEW VALUE FOR THE A RECORD

75.2.60.5

If there is more than one `A` row with name `@`, delete the extras and keep one.

If GoDaddy will not let you edit the A record

The old website builder may still be attached to the domain and holding it. In your GoDaddy products, open the old Websites + Marketing site and disconnect the domain from it. The DNS rows then become editable.

- 04 Find the row where **Type** is `CNAME` and **Name** is `www`. Change its value to your Netlify address, the one ending `.netlify.app`.

- 05 Save. **Change nothing else.**

These rows are your email and your Microsoft account. Leave every one of them exactly as it is, and do not delete any row you do not recognise:

DO NOT TOUCH

MX	(mail delivery)
TXT	(both of them – SPF and Microsoft)
autodiscover	(Outlook set-up)
msoid, email	(Microsoft sign-in)
_domainconnect	(GoDaddy's own automation)
_sip...	(two rows) (Teams)

Also add **no** row of type `AAAA`. Netlify does not serve the address you are pointing at over that kind of record, and adding one breaks the site.

- 06 Wait. It can take a few minutes or a few hours for the change to spread across the internet.

During that window the site may show a security warning about its certificate. That is normal and fixes itself once the change has spread.

Cancel the old subscription last, not first

Once the new site loads at `workingwithgod.live` and you have confirmed your email still arrives, then cancel Websites + Marketing. Cancelling first can take the old site down before the new one is reachable, leaving nothing live in between.

Google Analytics: who visits

This tells you how many people come to the site, which pages they read, and roughly where in the world they are. It is free and it is the standard tool everybody uses.

About 8 minutes

- 01 Go to `analytics.google.com` and sign in. Click **Start measuring**.
- 02 Account name: **Working With God**. Accept the defaults on the sharing settings and continue.
- 03 Property name: **workingwithgod.live**. Set your time zone and currency, then continue.
- 04 Answer the business questions however you like. Nothing here changes how it works. Choose **Generate leads** if you want a sensible default.
- 05 When it asks about a platform, choose **Web**. Enter `workingwithgod.live` as the website URL and give the stream a name.
- 06 You are now shown a **Measurement ID**. It starts with `G-` and looks like this:

COPY THIS AND SEND IT TO US

G-ABC1234XYZ

That is all we need. Ignore any instructions Google gives you about installing code.

Google Search Console: how people find you

Analytics tells you who arrived. Search Console tells you what they typed into Google first, and whether Google can read your pages properly. Different tool, different question.

About 5 minutes

Do Part 4 first and this becomes much easier

If Google Analytics is already set up on the same Google account, Search Console can usually verify you own the site by itself, with no codes to copy at all.

01 Go to `search.google.com/search-console` and sign in with the same Google account you used for Analytics.

02 You are offered two boxes. Use the one on the right, **URL prefix**, and enter:

```
https://workingwithgod.live
```

03 On the verification screen, expand **Other verification methods** and look for **Google Analytics**. Choose it and click Verify. It should succeed immediately.

If that option is missing or fails, stop here and tell us. There is another way that needs a change at GoDaddy, and we would rather make that change than have you do it.

04 Once verified, click **Sitemaps** in the left menu and submit:

```
sitemap.xml
```

This hands Google a list of every page on the site so it does not have to guess.

Do not expect data tomorrow. Search Console takes a few days to gather anything worth reading, and a few weeks to become genuinely useful. This is normal and is not a sign that something is broken.

Microsoft Clarity: how people actually use the site

This is the interesting one. Clarity records anonymous sessions, so you can watch where people scrolled, what they clicked, and the exact point at which they gave up and left. Free, with no limit on traffic.

About 5 minutes

- 01 Go to `clarity.microsoft.com` and sign in. You can use your Google account.
- 02 Click **New project**. Name it **Working With God**, enter `https://workingwithgod.live` as the website, and pick a category.
- 03 Clarity offers you several ways to install it. Ignore all of them and click **Settings**, then **Overview**.
- 04 Find the **Clarity project ID**. It is a short jumble of letters and numbers:

COPY THIS AND SEND IT TO US

abcde12345

On privacy. Clarity masks what people type, so passwords and form contents are not recorded. What you see is movement and clicks, not personal information.

The final check

One test proves the whole chain at once. Do this after we confirm we have wired in the codes you sent.

About 3 minutes, then 24 hours of patience

- 01 Go to `workingwithgod.live` and register for the Roundtable using your own name and email address, exactly as a real visitor would.

02 Within a minute or two, check all three of these:

WHERE TO LOOK	WHAT SHOULD BE THERE
Your email inbox	A message with the four details you typed
The spreadsheet	A new row on the Roundtable tab
Netlify, under Forms	The same registration, stored

03 Open that email and press **Reply**. Check that it addresses the person who registered, rather than a no-reply address. This is how you will answer real registrants.

04 Now wait a day. Then open Google Analytics and Clarity. Both should show at least one visit, yours. If they are still empty after 48 hours, tell us.

That is everything

Once that test passes, the site is live, registrations reach you two ways, and you can see who is visiting and what they do. Nothing above needs maintaining and nothing renews.

REFERENCE

If something looks wrong

Nothing here is ever lost. Every submission is stored in Netlify under **Forms** whatever else fails, so a problem below is an inconvenience, not a lost registration.

Nothing is reaching the spreadsheet

This has one of five causes, and there is one screen that tells you which. In Apps Script, click the **Executions** icon in the left-hand strip. It lists every time your script has actually run.

WHAT EXECUTIONS SHOWS	WHAT IT MEANS	WHAT TO DO
Nothing at all	The registration never reached your script. Google turned it away before it ran.	Causes 1–3 below.
A row in red	Your script ran and hit an error.	Click it, read the message, send us that line.
A row in green	It ran and thought it succeeded. The row went somewhere you are not looking.	Cause 5 below.

#	CAUSE	HOW TO CHECK IT IN UNDER A MINUTE
1	Access is set to "Anyone with a Google Account" instead of "Anyone". By far the most likely. Google answers with a hidden sign-in page and your script never runs.	Deploy > Manage deployments. Read the <i>Who has access</i> line. It must say exactly Anyone .
2	The address ends in <code>/dev</code> rather than <code>/exec</code> . This one works when you test it yourself and fails for everything else, which is why it costs people days.	Look at the last four characters of the address.
3	An old deployment is still live. "New deployment" was used instead of "New version", so there are now two addresses and the one in use runs the old code.	Deploy > Manage deployments. There should be exactly one active deployment, on the newest version.
4	The <code>SECRET</code> line was filled in. If it holds a password and the address does not carry the matching <code>?key=</code> , everything is refused in silence — by design, so a stranger learns nothing.	In the script, check the line reads <code>const SECRET = ''</code> ; with nothing between the quotes.
5	Wrong spreadsheet. The <code>SHEET_ID</code> is valid but belongs to a different file — often an old copy.	Open the browser test below. It prints the name of the sheet it is writing to.

The one-minute test that answers all five. Paste your `/exec` address into a browser address bar and press Enter. You will get back a line of text ending in a **verdict**. If it says anything other than "All good", it names the problem.

If you get a **Google sign-in page** instead of that text, that is cause 1 — go and change *Who has access* to **Anyone**.

Everything else

WHAT YOU SEE	WHAT IT USUALLY MEANS
Registered, but nothing anywhere at all	Form detection was switched on without rebuilding the site afterwards. Go back to Part 2, step 3.
Emails for the Roundtable but not the other forms	Only one of the three notifications was added. Part 2, step 4.
Two emails for every registration	Expected. One is Netlify's, one is your script's. Delete the Netlify one if it bothers you.
The website will not load at <code>workingwithgod.live</code>	The DNS change has not spread yet. Give it an hour. If it still fails the next morning, tell us.
A security or certificate warning on the site	Normal in the first minutes after the DNS change. It clears itself, usually within ten minutes.
Analytics or Clarity showing nothing	Either we have not added your codes yet, or fewer than 24 hours have passed. Both are common.
Your email stopped arriving	Stop and contact us immediately. Do not change anything else at GoDaddy in the meantime.

What all of this costs

SERVICE	WHAT IT DOES	COST
Netlify	Stores and serves the website, collects registrations	Free
Google Sheets and Apps Script	Keeps the record, sends your email	Free
Google Analytics	Visitor numbers	Free
Google Search Console	Search performance	Free
Microsoft Clarity	Session recordings	Free
GoDaddy	Your web address	The domain name only

None of these renew into a paid plan on their own, and none of them hold your card. Your GoDaddy bill should go *down* once the old website subscription is cancelled, because you will be paying only for the domain and your email.

Questions at any point, send a screenshot rather than guessing.

EchoPulse
