
Going *live.*

Moving **workingwithgod.live** from your old GoDaddy website to the new one. About twenty-five minutes of clicking, split over two sittings with an hour away from the computer in between. Your website stays reachable the whole way through, your email is never touched, and every single step can be undone.

The two error messages you hit last time are both explained in Part 2, before you touch anything. Neither was a fault, and neither will happen again.

START HERE

Before you begin

What is about to happen, in one paragraph, so that nothing below is a surprise.

Where things stand today. Your web address, `workingwithgod.live`, is registered at **GoDaddy**. Right now it points at the old GoDaddy website builder, the product billed to you as **Websites + Marketing**. Your email, `eliyahu@workingwithgod.live`, runs on Microsoft and is completely separate from the website, even though both are managed on the same GoDaddy page.

Where we are going. The new site is built and already live on **Netlify** at a temporary address. We point `workingwithgod.live` at Netlify instead of at the GoDaddy builder, confirm the new site is answering, and only then cancel that old subscription.

Everything in this guide can be undone

There is nothing below that cannot be put back. The exact settings you are changing are printed in this guide as they stand today, so if anything looks wrong at any point, retyping them returns your website to exactly how it is this morning. It takes about two minutes. The full instructions are in the box below — you will almost certainly never need them, and they are there so that you can work through this without worrying. What we do ask is that you do not *guess*. On the GoDaddy DNS page in Part 2, if a screen does not resemble what is described here, stop and send us a screenshot. Everywhere else in this guide the worst case is redoing a step.

TO PUT EVERYTHING BACK EXACTLY AS IT IS TODAY

A	@	13.248.243.5
A	@	76.223.105.230
CNAME	www	workingwithgod.live

Three rows, exactly as they are now. Restoring them brings the old site back. Tell us and we will do it for you — that is always an option, at any hour.

A few words this guide uses

These come up again and again below. Read this once and the rest needs no translation.

WORD	WHAT IT ACTUALLY MEANS
Domain	Your web address, <code>workingwithgod.live</code> . You already own it, and nothing in this guide changes that.
DNS	The internet's phone book. It turns the address a person types into the location of the computer that actually serves your website.
DNS record	One entry in that phone book: "for this name, go to this place." Part 2 changes three of these and leaves the rest exactly as they are.
A record / CNAME record	The two kinds of entry involved. An <code>A</code> record points a name straight at a number, like <code>75.2.60.5</code> . A <code>CNAME</code> points a name at another name instead. Both do the same job of saying where to go.
@	GoDaddy's shorthand for the address on its own, with no <code>www</code> in front — <code>workingwithgod.live</code> by itself. You will see it in the <i>Name</i> column.
Value	The third column in GoDaddy's table — the "go to this place" half of a row. In Part 2 you change the Value of two rows and nothing else about them.
TTL	"Time To Live." How long the rest of the internet is allowed to remember an old answer before it checks again. Turning it down first is what makes the switch fast rather than slow.
Certificate	The little padlock in the browser bar. Netlify creates yours automatically and free. You never buy one, upload one, or install one.

What you need

- A computer with a web browser. A phone will not work for this.
- Your **GoDaddy** sign-in, and your **Netlify** sign-in.
- Your phone, to photograph one screen before you change it. Ten seconds, and it means nothing on that page can be lost.
- About **25 minutes** of clicking, in two sittings: roughly five minutes, then an hour away from the computer, then twenty minutes to finish.

Reaching us — please do, at any point

There are several places below where this guide tells you to stop and ask rather than guess. Asking is always the right answer and never a bother. Reply to the message this guide came with, or use:

Email: _____
Phone: _____

A screenshot and the words “I’m at Part 2, step 5” is all we need. There is no such thing as too small a question here.

The one thing to say no to

If GoDaddy or Netlify ever offers to **change your nameservers**, or to **connect your domain to another service** automatically, decline it and tell us. Nameservers are a much bigger setting that hands over your whole phone book at once, and your email would go with it. This guide never touches them — we change three individual rows and nothing else.

The three parts

01 Quick check: is the new site ready?

A two-minute look at the new site before we switch your address to it

02 Point workingwithgod.live at the new site

Three rows change at GoDaddy. Your email keeps working throughout

03 Retire the old GoDaddy website

Last, not first — and keep the domain and the email

A note on scope. Your forms, your notification emails and your spreadsheet are already set up and already working — that was covered in full in the other guide we sent you (*Website Setup Guide*). This guide does not repeat any of it, and none of it is affected by anything below. It covers exactly one thing: moving `workingwithgod.live` from the old site to the new one.

PART 01

Quick check: is the new site ready?

A two-minute look at the new site, on its temporary address, before Part 2 switches your real address over to it.

About 2 minutes

- 01** Sign in at `app.netlify.com`. You will see one entry listed, **workingwithgod**. Click it. Near the top is a temporary web address, `workingwithgod.netlify.app`. Click it and have a look around. It is a fully working copy of the new site — it is simply not on your own address yet. That is what Part 2 fixes.

One thing that can look odd. Netlify is part-way through renaming things, so the same website is called a *site* on some screens and a *project* on others. They mean the same thing, and you only have one of them.

If anything looks wrong or missing — a page, a photo, some wording — write it down and send it to us, but do not let it hold up Part 2. Content is changed on the new site at any time, before or after your address points at it. The only thing that would stop Part 2 is the site not loading at all, and that would be ours to fix, not yours.

- 02** If you would like to see the whole chain working end to end, fill in one form on that temporary address yourself — the Roundtable one is a good choice — using your own name and email address.
- Within a minute or two the notification email should arrive and a new row should appear in your spreadsheet. If both happen, everything is ready.

This step is optional. If you already know the forms are working, skip straight to Part 2.

Nothing to set up here

This part is a check, not a setup step. Forms, notification emails and your spreadsheet work exactly the same whether a visitor reaches the site through `workingwithgod.netlify.app`, as they do today, or through `workingwithgod.live`, as they will after Part 2.

PART 02

Pointing `workingwithgod.live` at the new site

This is the only part of the guide that carries any real risk, so it is written in small steps with a way to check each one. Read the two boxes below first.

About 5 minutes, an hour away, then 20 minutes

In short. Both websites — old and new — are running right now, and both keep running throughout. You are changing which one your address points at, not switching anything off, so every visitor lands on a working site at every moment. Your email lives on separate rows and is not touched. Both of the error messages you met last time are expected, and both are dealt with below.

Your email lives on this same page

Mail to `eliyahu@workingwithgod.live` is delivered by a handful of rows sitting on the very same GoDaddy screen you will be editing. We change three rows and leave every other one exactly as it is. The full list of what not to touch is printed before you make any change, and nothing below will interrupt your mail.

The two messages you already saw. Both were correct, and both are handled below.

You met these last time and stopped, which was the right call. Here is what each one actually was.

“Record name `www` conflicts with another record.” GoDaddy was protecting you, and it was right. The video told you to *add* a new row; your domain already has a `www` row, and a name may be a `CNAME` or an `A` but never both. Nothing was broken and nothing needed fixing. **Step 6 below edits the row you already have instead of adding one, so the message will not appear.**

“We could not provision a Let’s Encrypt certificate.” A statement of fact, not a fault. A certificate cannot be issued for an address that does not yet reach Netlify, and at that moment your address still pointed at the old GoDaddy site. **It resolves itself, with no action from you, once step 7 finishes.** There is nothing to press and nothing to buy.

- 01 Netlify first, before you touch GoDaddy.** At `app.netlify.com`, click **workingwithgod**, then open **Domain management** in the left-hand menu. On some screens it sits under **Project configuration** or **Project settings**.

Click the button offering to **add a domain you already own** and type `workingwithgod.live`. Then do it a second time for `www.workingwithgod.live`.

Netlify will ask how this address’s DNS is managed. Choose the option meaning **“I will manage this myself, elsewhere”** — worded as *external DNS provider* or *third-party DNS*, or wording close to it. Any option that is **not** “set up Netlify DNS” is correct, because your domain stays at GoDaddy throughout.

You will know this worked when: both addresses appear in a list on that page, each marked *Pending DNS verification* or *Awaiting external DNS* in amber. That amber wording is correct at this stage — it means “Netlify is ready and waiting for GoDaddy”, which is exactly true.

- 02 Write down the value you will need in step 6.** Click **Pending DNS verification** next to `www.workingwithgod.live`. Netlify prints the exact records for your project.

The one you need is the `.netlify.app` name. It will read:

COPY THIS DOWN NOW

`www` should point at: `workingwithgod.netlify.app`

That is the same address you visited in Part 1, so it should match. If your screen ever shows something different, use what the screen says — it is always right about your own project.

03 Now GoDaddy. Sign in, find `workingwithgod.live` in your products, and open **DNS** or **Manage DNS**.

You will see a table of rows with columns headed Type, Name and Value. This is the address book that tells the internet where to find your things.

Before you change anything, photograph this table with your phone. Get the whole list in shot. You will almost certainly never need it, and it means nothing on this page can be lost.

Every row not named below belongs to your email. Leave all of them alone.

You are changing exactly three rows in this guide. These are the others, and they are what deliver `eliyahu@workingwithgod.live`. Do not edit, delete, or open any of them:

MX	(mail delivery)
TXT	(all three of them)
autodiscover	(Outlook set-up)
msoid	(Microsoft sign-in)
email	(GoDaddy's own mail service)
lyncdiscover	(Teams)
_domainconnect	(GoDaddy's own automation)
_sip...	(two rows) (Teams)

If you see a row that is not on this list and is not one of the three you are changing, leave it. Unknown does not mean wrong. And note that GoDaddy saves each row as you save that row — there is no final Save button for the whole page, and nothing is left pending.

04 **Lower one setting on three rows, then walk away for an hour.** *This step is skippable, but it is the difference between ten minutes and half a day. We recommend doing it.*

You are editing **three rows** — the two `A` rows named `@`, and the `CNAME` row named `www` — changing **one field on each and nothing else**. On each row: click the pencil, find **TTL**, choose **Custom** from the dropdown, type **600**, and save. Then do the next. Three rows, three saves.

Why, when step 5 deletes one of these rows anyway: TTL is how long the rest of the internet is allowed to keep believing your *current* answer. Right now that is one hour. Setting it to 600 seconds and then waiting an hour means the whole internet has thrown away the long-lived answer and is checking every ten minutes instead — so when you make the real change, it is picked up in about ten minutes rather than an hour. You are shortening the memory of the answer you are about to replace.

You will know this worked when: all three rows show **600** (or **10 minutes**) in the TTL column.

Now leave it for an hour. Make a coffee. This is a safe place to stop — nothing is half-done, and your site is exactly as it was this morning.

- 05 The plain address.** This points `workingwithgod.live` itself at the new site. You have **two** rows of type `A` named `@`, and both belong to the old website. You will change one and remove the other.

FIRST — EDIT THIS ROW

A @ 13.248.243.5 → change the Value to 75.2.60.5

THEN — DELETE THIS ONE

A @ 76.223.105.230

Check twice before deleting. The row you remove must have `A` in the Type column, `@` in the Name column, and `76.223.105.230` in the Value column. If all three do not match, it is not the row — leave it and send us a screenshot.

Both old rows have to go. If one is left behind, the internet treats every `A` row on that name as equally valid and sends visitors to whichever it happens to pick — some to the new site, some to the old one, unpredictably. It also stops your security certificate being issued, because the check that proves you own the address can land on the old site instead of the new one.

You will know this worked when: the table shows exactly **one** row with Type `A` and Name `@`, and its Value is `75.2.60.5`.

If GoDaddy will not let you edit the A record

The old website builder is still attached to the domain and holding it. In your GoDaddy products, open **Websites + Marketing** and disconnect the domain from it. The DNS rows then become editable.

06 The www address. Edit the row that is already there — do not add one. Find the existing row of type `CNAME` named `www`, click the pencil or *Edit* beside it, and change **only its Value**:

```
Type:  CNAME    leave exactly as it is
Name:  www      leave exactly as it is
Value: workingwithgod.netlify.app ← the only field you change
TTL:   600
```

Type it with no `http`, no `www` in front, and no full stop at the end. Its Value today reads `workingwithgod.live`.

If GoDaddy refuses with “conflicts with another record”, you are on the *Add* screen rather than the *Edit* one. Cancel out of it, scroll the list, and find the `www` row that already exists.

You will know this worked when: the `www` row still says `CNAME` in the Type column — not `A` — and its Value now ends in `.netlify.app`.

07 Check the table against this, then wait. Three rows have changed and nothing else has:

```
A      @      75.2.60.5      ← edited (was 13.248.243.5)
                                ← and no second A row named @
CNAME  www    workingwithgod.netlify.app ← edited
```

If you lowered the TTL an hour beforehand, most visitors see the new site within about **ten minutes**, and everyone has it within the hour. If you skipped that step, allow up to an hour for most and a few hours for the last stragglers.

The quickest check: open `workingwithgod.live` in a **private** or **incognito** window every few minutes. The moment the new site appears there, it has switched. A normal window may keep showing you a saved copy of the old site for hours, which tells you nothing — that is why the private window matters.

The other check: on Netlify's Domain management page, the line for `workingwithgod.live` currently reads *Pending DNS verification* in amber. When the change is picked up, that one line turns to a green tick. You are watching a single line change colour, not the whole page.

For the first few minutes after it switches, the address may show a security warning about its certificate. Netlify re-tries automatically every ten minutes, so allow roughly ten to twenty minutes after the switch, and longer if you skipped the TTL step. It clears itself. Do not press the certificate button repeatedly and do not upload a certificate of your own.

Your registration forms and their emails are not affected by any of this

The forms belong to the website itself, not to the web address. Changing which address points at the site does not touch how a form is collected, and does not touch the emails that go out when somebody registers. Nothing about that setup is altered, switched off, or needs redoing. The only difference is that a form is filled in on `workingwithgod.live` instead of on the temporary address.

Leave the old website alone for now

It costs nothing to let it keep running for a few more days, and while it is running you have something to fall back on. Part 3 is where you cancel it, and only after four checks have passed.

PART 03

Retiring the old GoDaddy website

Only once the new site is answering at your own address. Doing this first is the one way to actually take your website offline, so the order here matters more than the steps do.

About 5 minutes

Read this before you start Part 3

Cancelling here **removes the old website immediately**, not at the end of the month you have already paid for. Once it is gone it is no longer your fallback. That is why all four checks below have to pass first, and why there is no hurry — an extra month of a subscription is far cheaper than a website that is down.

If you would rather keep the fallback until the paid term simply runs out, there is a gentler option: **Renewals and Billing > Manage Subscriptions > Turn off Auto-Renew > Confirm Cancel**. That stops the next bill and leaves the old site running until then. Tell us if you would prefer that and we will walk you through it.

First: four checks. All four must pass.

- 01 Open a **private** or **incognito** browser window and go to `workingwithgod.live`. The new site loads.

A private window matters. A normal one may still be showing you a saved copy of the old site, which tells you nothing.

- 02 In the same window, go to `www.workingwithgod.live`. The new site loads there too, with no security warning.
- 03 Send yourself an email from any other address to `eliyahu@workingwithgod.live`, and confirm it arrives. Then send one *from* that address to yourself, and confirm that arrives too.

Both directions. Receiving works through one set of rows and sending through another, so testing only one direction proves only half of it.

- 04 Register on the new site using your own details, and confirm the email reaches you.

If any one of these four does not happen, stop here and tell us. Do not go on to the cancellation below — there is no deadline, and nothing is costing you anything meaningful in the meantime.

Then, and only then: cancelling the old subscription

Only if all four checks above passed.

- 01 Sign in at `account.godaddy.com/products`, or click **My Products** from the menu at the top of any GoDaddy page.

Look for the line billed as **Websites + Marketing**. That is the one to cancel.

Cancel the website. Do not cancel the domain or the email.

All three sit on the same products page and it is easy to tick the wrong one.

```
Websites + Marketing ← cancel this one
Domain: workingwithgod.live ← KEEP
Microsoft 365 / Email ← KEEP
```

Cancelling the domain would hand your web address back to the world. Cancelling the email would stop your mail. Neither is recoverable in a hurry.

If you cannot find that exact name, or you see a line called **Airo** and are unsure whether it is the same thing, stop and send us a screenshot. GoDaddy sells Airo as a separate product too, so the names are not always interchangeable — and this is the one step in the guide that cannot be undone.

- 02 Cancelling is a few small screens rather than one click, and there is a final email you must open before it actually finishes. None of the steps are difficult, but missing the last one is the easiest way to think you are done when you are not.

THE SCREENS, IN ORDER

1. Next to Websites + Marketing, choose **Turn off Auto-Renew**
2. Pick any reason from the list, then **Continue to Cancel**
3. On the next screen, select **Click here**
4. Tick the acknowledgment box, then select **Send email**
5. Open the email GoDaddy sends and select **Yes, I Want to Delete!**
6. Back on the GoDaddy page, a final **Delete product** confirms it

Button wording changes from time to time; if a label is close but not identical, that is fine. If a whole screen is missing or looks different, stop and ask.

If you see a plain *Delete* button instead of *Turn off Auto-Renew*, auto-renew was already switched off. Select it and go straight to the final **Delete product** confirmation — GoDaddy may still email you first.

That confirmation email is not spam and not optional. GoDaddy sends it on purpose, so a subscription cannot be cancelled by one accidental click. If it has not arrived within a few minutes, check your spam folder before trying again.

- 03 Along the way GoDaddy may ask why you are leaving, or offer a discount to stay. Answer however you like and decline — it does not affect anything else.

If a screen warns that “*your website will no longer be available*”, that is correct and expected. It means the *old* site. Your new site is somewhere else entirely and is unaffected — which is exactly what checks 1 and 2 confirmed.

That is the whole move

Your address now points at the new site, your email is untouched, and your GoDaddy bill is smaller by the price of a website builder you no longer need.

If something looks wrong

Everything on this list is either normal, or has a one-line fix. None of it means the site is lost.

During the switchover

WHAT YOU SEE	WHAT IT MEANS AND WHAT TO DO
Netlify says <i>"We could not provision a Let's Encrypt certificate"</i>	Expected until the address actually reaches Netlify — a certificate cannot be issued for an address that still points somewhere else. Netlify re-tries every ten minutes on its own. Do not upload your own certificate and do not keep pressing the certificate button.
GoDaddy says <i>"Record name www conflicts with another record"</i>	You are adding where you should be editing, and GoDaddy is right to refuse. A name can be a <code>CNAME</code> or an <code>A</code> , never both, and <code>www</code> is already a <code>CNAME</code> . Cancel the Add screen, find the existing <code>www</code> row in the list, and edit its Value. Part 2, step 6.
Your own address shows a Netlify page saying <i>Not Found</i>	The GoDaddy rows were changed but the domain was never added on the Netlify side. Go back and do Part 2, step 1. Nothing is broken and nothing is lost — the site reappears within minutes of adding it.
You think you deleted the wrong row	Nothing here is unrecoverable. The three original rows are printed in the box on the second page of this guide — retype the missing one exactly, or send us a screenshot and we will put it back.
The old site still loads at <code>workingwithgod.live</code>	Normal for the first minutes. Your computer is still remembering the old answer. Try a private window. If it is still the old site an hour later, check your rows against Part 2, step 7.
The plain address works but <code>www.</code> does not, or the other way round	Only one of the two rows was changed. Go back and check both step 5 (the <code>A</code> row) and step 6 (the <code>www</code> row).

WHAT YOU SEE	WHAT IT MEANS AND WHAT TO DO
GoDaddy will not let you edit the A row at all	The old GoDaddy website is still holding the domain. Open Websites + Marketing in your products and disconnect the domain from it, then come back.
Netlify still shows the domain as <i>not configured</i> or with a warning	It checks on a timer. Give it fifteen minutes, then use the Retry DNS verification link (or wording close to it) on the Domain management page.
Someone tells you to add an AAAA record	Do not, and tell us. The Netlify address in step 5 has no AAAA equivalent, so such a row would send some visitors nowhere.
A form on the new site says nothing happened, or you never got the notification email	Not a deployment problem — forms and email are covered separately in the other guide we sent you (<i>Website Setup Guide</i>), which has its own troubleshooting section.
Your email stopped arriving	Stop, and contact us immediately. Do not change anything else at GoDaddy in the meantime. This is recoverable, and it is recoverable fastest if nothing else has been touched since.

Retiring the old website (Part 3)

WHAT YOU SEE	WHAT IT MEANS AND WHAT TO DO
There is no plain Delete or Cancel button, only Turn off Auto-Renew	Normal, and the more common case. Select it, then work through the reason, the extra screen, the tick box, and the confirmation email GoDaddy sends.
You turned off auto-renew but the product is still listed as active a few minutes later	Check your email, including spam, for GoDaddy's confirmation message and select Yes, I Want to Delete! inside it. The cancellation does not finish until that link is clicked.
You see a line called Airo and are not sure whether it is the same thing	Do not assume it is. GoDaddy sells Airo as a separate product as well as using the name as a general brand. Cancel only the line billed as Websites + Marketing . If that name is not there, send us a screenshot before cancelling anything.

What this costs from here

SERVICE	WHAT IT DOES	COST
Netlify	Stores and serves the new website, collects form submissions	£0 / \$0 at your traffic
GoDaddy — domain	Your web address, <code>workingwithgod.live</code>	The domain renewal only
GoDaddy — Microsoft 365	Your email	Unchanged
GoDaddy — old website builder	Websites + Marketing	Cancelled

Netlify never charges your card without being asked — there is no card on the account and the free plan has a hard ceiling rather than a bill that grows. You may see the word “credits” on the Netlify dashboard: that is our allowance for publishing updates to the site, which we manage, not a charge to you. Your GoDaddy bill should go *down* after Part 3, because you will be paying for the domain name and your email, and no longer for a website builder.

One last thing

Nothing in this guide is a one-way door except the final cancellation in Part 3, and that one waits behind four checks. Everywhere else, if something looks wrong, stop where you are and send us a screenshot with the part and step number. That is always the right move, and it is never a bother.

Questions at any point, send a screenshot rather than guessing.

EchoPulse
